

Women's Hair Loss

Most cases of hair loss in women are due to inherited female pattern balding, but medical conditions can also be involved, such as low thyroid or iron levels, hormonal imbalances such as elevated testosterone, binge dieting, and pregnancy. Another cause of hair loss in women is the distortion of hair growth and scarring as a result of prior plastic surgery, injury or burns.

Most of these conditions are treatable, giving women many options for restoration. We at Hair Restoration & Aesthetics of Buffalo are particularly aware of the tremendous need women of all ages have to preserve and restore hairline and density. Call immediately for a free and completely confidential evaluation of your medical and surgical options.
